[摘要] 目的 探讨磁共振成像(MRI)中结合带区异常增厚、T₁加权像(WI)和(或)T₂WI高信号改变对子宫腺肌症的诊断价值。方法 回顾性分析海军军医大学(第二军医大学)长海医院2013年1月至2016年1月收治的37例经病理证实为子宫腺肌症患者的MRI资料,随机选取37例同期行MRI检查的子宫及卵巢正常者作为对照。测量并比较两组患者的子宫结合带厚度最大值(JZ_{max})、结合带厚度最大值与最小值的差值(JZ_{diff})、JZ_{max}与肌层厚度最大值的比值(JZ_{max}/M_{max}) ,并比较两组JZ_{max}、JZ_{diff}和JZ_{max}/M_{max}的差异。绘制受试者工作特征(ROC)曲线,计算JZ_{max}、JZ_{diff}和JZ_{max}/M_{max}诊断子宫腺肌症的曲线下面积(AUC)、截断值、灵敏度、特异度及准确度。观察患者T₁WI和(或)T₂WI上子宫壁内有无高信号及其类型。结果 子宫腺肌症组与对照组的JZ_{max}、JZ_{diff}和JZ_{max}/M_{max}差异均有统计学意义(P 均<0.01)。JZ_{max}、JZ_{diff}、JZ_{max}/M_{max}诊断子宫腺肌症的AUC分别为0.95、0.90、0.85,当JZ_{max}≥10 mm时其灵敏度、特异度和准确度分别为78.8%、97.3%和88.6%,JZ_{diff}≥3.4 mm时分别为81.8%、91.9%和87.1%,JZ_{max}/M_{max}≥61%时分别为72.7%、83.8%和78.6%。18例(48.6%)子宫腺肌症患者仅见T₂WI高信号,14例(37.8%)可见T₁WI、T₂WI均高信号,多呈飘雪征改变;线状条纹征5例(13.5%),微囊征5例(13.5%),浆膜下囊性出血征1例(2.7%)。结论 JZ_{max}≥10 mm、JZ_{diff}≥3.4 mm、JZ_{max}/M_{max}≥61%对子宫腺肌症具有较好的诊断价值,其中JZ_{max}的诊断效能最佳。T₁WI和(或)T₂WI中的飘雪征、线状条纹征、微囊征、囊性出血征诊断子宫腺肌症具有独特性。综合评估这些征象可以提高MRI的诊断价值,为早期准确诊断子宫腺肌症提供可能。

[Abstract] Objective To investigate the value of abnormal thickening of the junctional zone, and T₁ weighted imaging (WI) and (or) T₂WI hyperintense in magnetic resonance imaging (MRI) for the diagnosis of uterine adenomyosis. Methods The MRI images of 37 cases of adenomyosis confirmed by pathology in Shanghai Hospital of Navy Medical University (Second Military Medical University) from Jan. 2013 to Jan. 2016 were retrospectively analyzed, and 37 cases of normal uterus and ovary confirmed by MRI in the same period were randomly selected as controls. The maximal junctional zone thickness (JZ_{max}), the difference between the smallest and largest junctional zone thickness (JZ_{diff}), and the ratio of JZ_{max} to maximal myometrium thickness (JZ_{max}/M_{max}) were measured and compared between the two groups. The receiver operating characteristic (ROC) curve of each parameter in diagnosis of adenomyosis was drawn, and the area under curve (AUC), cut-off value, sensitivity, specificity and accuracy were calculated. In addition, the T₁WI and T₂WI hyperintense and their types in the uterine wall were observed. Results There were significant differences in JZ_{max}, JZ_{diff} and JZ_{max}/M_{max} between the adenomyosis and control groups (all P <0.01). The AUC for the diagnosis of adenomyosis by JZ_{max}, JZ_{diff}, and JZ_{max}/M_{max} were 0.95, 0.90, and 0.85, respectively. When JZ_{max}≥10 mm, the sensitivity, specificity and accuracy were 78.8%, 97.3% and 88.6%, respectively; when JZ_{diff}≥3.4 mm, those were 81.8%, 91.9% and 87.1%, respectively; When JZ_{max}/M_{max}≥61%, those were 72.7%, 83.8% and 78.6%, respectively. Eighteen cases (48.6%) had only T₂WI

hyperintense, while 14 cases (37.8%) had both T₁WI and T₂WI hyperintense; most of them showed snowdrift sign on T₁WI and (or) T₂WI. T₁WI and (or) T₂WI showed linear stripe sign in 5 cases (13.5%), microcapsule sign in 5 cases (13.5%), and cystic hemorrhage syndrome in 1 case (2.7%). **Conclusion** JZ_{max}≥10 mm, JZ_{diff}≥3.4 mm and JZ_{max}/M_{max}≥61% have significant diagnostic value in diagnosis of adenomyosis, and JZ_{max} has the best diagnostic efficiency. Snowdrift sign, linear stripe sign, microcapsule sign and cystic hemorrhage sign on T₁WI and (or) T₂WI are unique for the diagnosis of adenomyosis. Comprehensive evaluation of the above signs can improve the diagnostic value of MRI and early accurate diagnosis of adenomyosis.

[Key words] uterine adenomyosis; magnetic resonance imaging; junctional zone; pathology

[Acad J Sec Mil Med Univ, 2018, 39(6): 591-596]

子宫腺肌症是一种常见的妇科良性疾病，因其临床表现缺乏特异性，术前诊断率仅为2%~26%^[1]。随着非侵袭性影像学技术的进展，磁共振成像（magnetic resonance imaging, MRI）成为目前子宫腺肌症最可靠的检查方法，其中结合带区异常增厚、T₁WI和（或）T₂WI高信号是其诊断的主要征象，然而，MRI诊断标准尚未统一，且其诊断征象易受激素水平、子宫肌层收缩、结合带蠕动等影响^[2-6]。本研究通过回顾性分析海军军医大学（第二军医大学）长海医院2013年1月至2016年1月37例经病理证实的子宫腺肌症患者的MRI资料，以明确子宫结合带厚度最大值（maximal junctional zone thickness, JZ_{max}）、JZ_{max}与结合带厚度最小值（minimal junctional zone thickness, JZ_{min}）的差值（difference between the smallest and largest junctional zone thickness, JZ_{diff}）、JZ_{max}与肌层厚度最大值（maximal myometrial thickness, M_{max}）的比值（JZ_{max}/M_{max}）3个结合带厚度评估参数和T₁WI、T₂WI高信号的诊断效能，加深对子宫腺肌症MRI主要诊断征象的认识，提高诊断水平。

1 资料和方法

1.1 病例资料 纳入海军军医大学（第二军医大学）长海医院2013年1月至2016年1月经病理证实且术前行MRI检查的37例子宫腺肌症患者为子宫腺肌症组。子宫腺肌症组患者年龄为32~65岁，平均（46.7±7.3）岁。临床主要表现为痛经、月经量增多、不孕等，其中有17例患者合并子宫肌瘤、13例合并卵巢巧克力囊肿。收集同期行MRI检查的37例子宫及卵巢无明显病变者作为对照组。对照组患者年龄为18~79岁，平均（54.6±13.2）岁，其中肠癌20例、盆腔正常

14例、痔疮2例、溃疡性结肠炎1例。

1.2 MRI扫描参数 采用德国西门子1.5T超导MRI系统行MRI检查。检查时避开月经期，检查前取下金属节育环，适度充盈膀胱。自旋回波（spin echo, SE）T₁加权像（weighted imaging, WI）扫描参数：重复时间（repetition time, TR）为550 ms，回波时间（echo time, TE）为14 ms，层厚为5 mm，间距为1.5 mm，矩阵为256×256。快速自旋回波（turbo spin echo, TSE）T₂WI扫描参数：TR为4 500 ms，TE为96 ms，层厚为5 mm，间距为1.5 mm，矩阵为256×256；T₂WI抑脂序列扫描参数：TR为3 000 ms，TE为64 ms，层厚为5 mm，间距为1.5 mm，矩阵为256×256。分别行矢状面、横断面扫描，部分加扫冠状面。

1.3 图像阅读与测量方法 将MRI扫描图像发至图像存储与传输系统（picture archiving and communication system, PACS），分别由2位有经验的影像科医师阅片分析。在中矢状面观察和测量JZ_{max}、M_{max}和JZ_{min}，并计算JZ_{diff}（JZ_{diff}=JZ_{max}-JZ_{min}）和JZ_{max}/M_{max}。观察两组T₁WI和（或）T₂WI上子宫壁内有无高信号及其类型。

1.4 统计学处理 采用SPSS 18.0软件进行统计学分析。JZ_{max}、JZ_{diff}数据不符合正态分布，以中位数（下四分位数，上四分位数）表示，组间比较采用秩和检验；JZ_{max}/M_{max}数据符合正态分布，以 $\bar{x}\pm s$ 表示，组间比较采用两样本均数比较的t检验。根据病理结果对各参数绘制受试者工作特征（receiver operating characteristic, ROC）曲线，计算ROC曲线下面积（area under curve, AUC）、截断值、灵敏度、特异度及准确度。检验水准（ α ）为0.05。

2 结 果

2.1 子宫结合带厚度 子宫腺肌症组患者中除4例(10.8%)结合带显示不清外,其余在T₂WI矢状位上均表现为结合带不同程度增厚,呈弥漫性均匀增厚,与外肌层分界不清(典型图像见图1)。在T₂WI矢状位上对照组结合带均可清晰显示,呈均匀或不均匀低信号影。子宫腺肌症组和对照组患者的JZ_{max}、JZ_{diff}、JZ_{max}/M_{max}值见表1,两组的JZ_{max}、JZ_{diff}、JZ_{max}/M_{max}差异均有统计学意义(P 均<0.01)。JZ_{max}、JZ_{diff}和JZ_{max}/M_{max}诊断子宫腺肌症的ROC曲线分析结果显示,与其他两个参数相比,JZ_{diff}≥3.4 mm诊断子宫腺肌症的

灵敏度最高,而JZ_{max}≥10 mm诊断子宫腺肌症的AUC、特异度和准确度最高(图2、表2)。

JZ_{max}: Maximal junctional zone thickness; JZ_{diff}: Difference between the smallest and largest junctional zone thickness; JZ_{max}/M_{max}: Ratio of JZ_{max} and maximal myometrium thickness; ROC: Receiver operating characteristic

2.2 T₁WI 和 (或) T₂WI 高信号 子宫腺肌症患者中18例(48.6%)仅见T₂WI高信号,14例(37.8%)T₁WI、T₂WI均可见高信号,多呈飘雪

征改变(图3);线状条纹征(图4A~4C)5例(13.5%),微囊征(图4D)5例(13.5%),浆膜下囊性出血征1例(2.7%)。对照组T₁WI、T₂WI均未见明显高信号。

3 讨 论

子宫腺肌症指子宫肌壁内出现具有活性的子宫内膜或内膜样组织,常伴周围平滑肌肥大和增生^[7],多数研究者认为该病是由于子宫内膜与肌层间没有黏膜下层,内膜基底层的腺体及间质直接侵及内肌层所致^[4,8-10]。MRI是现今国内外公认的最可靠的子宫腺肌症检查方法,但目前子宫腺肌症的MRI诊断标准不统一、临床医师对诊断征象认识不充分,为其准确诊断带来了一定挑战^[3-4,11]。通过本研究并结合相关文献,现将子宫腺肌症的MRI主要诊断征象分析如下。

3.1 子宫结合带区异常增厚 结合带正常结构破坏与异常增厚是MRI诊断子宫腺肌症的重要征象

之一, 主要表现为 T_2 WI 结合带区低信号且呈弥漫性或局灶性增厚, 经病理证实为异位内膜周围增生肥大的平滑肌组织所致^[12]。然而, 类似子宫

内膜, 结合带随卵巢激素变化存在周期性增厚及生理性蠕动^[2,4,9,11], 为子宫腺肌症的 MRI 诊断带来挑战。

表 2 JZ_{max} 、 JZ_{diff} 、 JZ_{max}/M_{max} 诊断子宫腺肌症的 ROC 曲线下面积、截断值、灵敏度、特异度和准确度

Tab 2 AUC of ROC curve, cut-off value, sensitivity, specificity and accuracy of JZ_{max} , JZ_{diff} , and JZ_{max}/M_{max} for diagnosis of adenomyosis

Parameter	AUC	Cut-off value	Sensitivity (%)	Specificity (%)	Accuracy (%)
JZ_{max}	0.95	10 mm	78.8	97.3	88.6
JZ_{diff}	0.90	3.4 mm	81.8	91.9	87.1
JZ_{max}/M_{max}	0.85	61%	72.7	83.8	78.6

JZ_{max} : Maximal junctional zone thickness; JZ_{diff} : Difference between the smallest and largest junctional zone thickness; JZ_{max}/M_{max} : Ratio of JZ_{max} and maximal myometrium thickness; ROC: Receiver operating characteristic; AUC: Area under curve

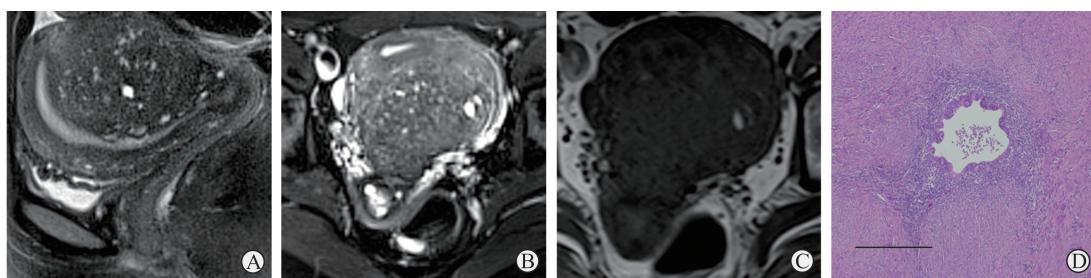

图 3 呈飘雪征表现的子宫腺肌症患者的 MRI 及病理图

Fig 3 MRI images of snowdrift sign in patients with adenomyosis and the pathology

A 32-year female patient. A, B: Sagittal (A) and axial (B) fat-suppressed T_2 WI showed that the posterior wall of the uterus was full, with a round conjunctival hypotensive mass and unclear local boundaries, scattered the patchy or small saccular hyperintense (snowdrift sign); C: Axial T_1 WI showed that patchy hyperintense was scattered in the lesions with isointense signals, but the number of hyperintense was reduced obviously; D: Pathology showed the endometrioid tissue was found in the myometrium of the uterus, and the surrounding smooth muscle proliferated, with disordered and knitted arrangement (H-E staining, scale bar=500 μ m). MRI: Magnetic resonance imaging; WI: Weighted imaging

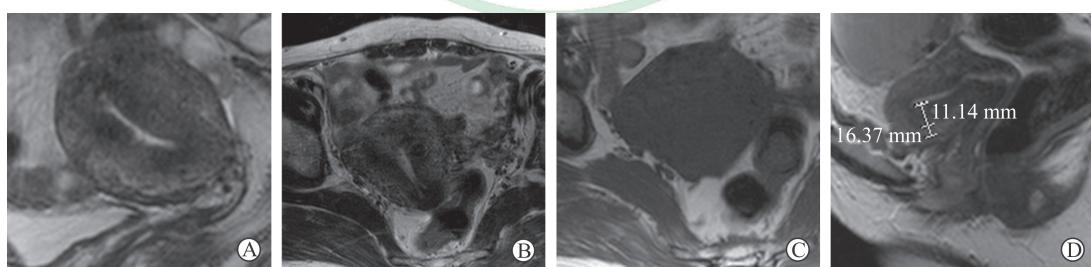

图 4 T_2 WI 呈线状条纹征和微囊征表现的子宫腺肌症患者的典型图像

Fig 4 Typical images of linear stripe sign and microcapsule sign on T_2 WI in patients with adenomyosis

A-C: A 56-year female patient. Sagittal T_2 WI (A) showed that the junctional zone was thickened evenly, and a short stripe of hyperintensity (linear stripe sign) extending from the endometrium to the junction zone was seen in the anterior wall of the uterus. The linear stripes were not well displayed on axial T_1 WI (B) and T_2 WI (C); D: A 45-year female patient. Sagittal T_2 WI showed that the thickness of the junctional zone was not uniform, and there was dot-shaped high-signal shadow wrapped in annular low-signal (microcapsule sign) in junction zone of the anterior wall, with $JZ_{max}=11.14$ mm, but $JZ_{max}/M_{max}=68.1\%$. WI: Weighted imaging; JZ_{max} : Maximal junctional zone thickness; JZ_{max}/M_{max} : Ratio of JZ_{max} and maximal myometrium thickness

目前结合带增厚常用 JZ_{max} 、 JZ_{diff} 及 JZ_{max}/M_{max} 3 个参数进行评估, 本研究通过绘制 ROC 曲线发

现 $JZ_{max}\geq 10$ mm、 $JZ_{diff}\geq 3.4$ mm、 $JZ_{max}/M_{max}\geq 61\%$ 均具有显著的诊断价值。 $JZ_{max}>12$ mm 是目前诊

断子宫腺肌症接受度最高的标准^[13-14], 其诊断子宫腺肌症的灵敏度为63%、特异度为96%, 准确度为85%^[4]; 而本研究中 $JZ_{max} \geq 10$ mm 时其诊断效能最佳, 灵敏度为78.8%、特异度为97.3%、准确度为88.6%, 与上述文献^[4]报道的准确度及特异度相似, 且其灵敏度更高, 表明 $JZ_{max} \geq 10$ mm 具有较高的临床诊断价值。本研究中 $JZ_{max}/M_{max} \geq 61\%$ 时的诊断灵敏度为72.7%、特异度为83.8%、准确度为78.6%, 虽然其灵敏度高于文献^[15]报道

($JZ_{max}/M_{max} > 40\%$ 时的灵敏度为65%), 但其报道的特异度为92%、准确度为83%。分析其原因, 文献中患者年龄为30~88岁, 平均年龄约51岁, 绝经后患者占31%^[15], 而本研究中绝大多数患者处于育龄期。绝经后子宫外肌层由于蜕变、脱水, T_2 WI信号常降低, 接近结合带区信号^[4], 这可能是本研究中 JZ_{max}/M_{max} 诊断截断值高于既往研究^[15]的原因, 但受研究样本量限制, 特异度和准确度有待提高, 诊断标准仍需进一步明确。有研究发现 $JZ_{diff} > 4.6$ mm 时有一定的诊断价值, 其诊断效能略高于 $JZ_{max} > 12$ mm, 尤其是在特异度方面^[16-17]。目前关于 JZ_{max} 的诊断灵敏度、特异度及准确度的描述仍比较少, 本研究结果显示, $JZ_{diff} \geq 3.4$ mm 时的诊断灵敏度、特异度和准确度均较高(灵敏度为81.8%、特异度为91.9%、准确度为87.1%), 有较高临床诊断参考价值。

本研究发现 JZ_{max} 诊断子宫腺肌症的特异度优于 JZ_{diff} 和 JZ_{max}/M_{max} , 而 JZ_{diff} 诊断子宫腺肌症的灵敏度优于 JZ_{max} 和 JZ_{max}/M_{max} , 三者在子宫腺肌症的MRI诊断中发挥着不同作用。 JZ_{max} 的诊断效能最佳, 简单直观且易于评估, 但因结合带受卵巢激素影响较大, 因此不仅常存在个体先天发育的差异, 还存在周期性蠕动及生理性增厚的差异^[2,4,11]。此外, 受病灶在子宫肌层位置、大小的影响, 结合带厚度也存在病理性差异, 导致 JZ_{max} 的诊断效能局部受限。 JZ_{max}/M_{max} 为结合带与相应肌层最大厚度的比值, 其诊断能有效降低子宫个体先天发育差异的影响; JZ_{max}/M_{max} 还在局限性子宫腺肌症微小病灶中发挥着独特的诊断优势, 但 JZ_{max}/M_{max} 为间接评估指标, 受 JZ_{max} 及 M_{max} 相关因素的影响, 诊断上常存在误差, 尤其是当肌层内合并子宫肌瘤等占位性病变时, 会造成部分漏诊。 JZ_{diff} 能降低月经周期结合带弥漫性生理性增厚的影响, 在诊断腺

肌瘤局部累及结合带及结合带不规则明显增厚时具有良好作用, 但当结合带弥漫性均匀异常增厚或结合带蠕动所致结合带局部增厚时其诊断意义受限。

此外, 本研究发现有4例(10.8%)患者结合带显示欠清, 低于文献报道的20%~30%, 因文献提及结合带在经前期、孕期及绝经后期多显示欠清, 无法评估^[4], 而本次研究对象多为育龄期女性, 受研究样本年龄分布及样本数量限制, 具有一定的局限性。

3.2 T_1 WI 和(或) T_2 WI 高信号

子宫腺肌症患者常在 T_2 WI 低信号结合带或腺肌瘤病灶内见散在斑片状、小囊样或不规则形高信号, 典型者呈飘雪征, 部分亦在 T_1 WI 中见类似高信号灶, 但数量少于 T_2 WI。经病理证实仅表现为 T_2 WI 高信号的病灶为异位内膜组织或囊性扩张内膜腺体, 而 T_1 WI、 T_2 WI 均表现为高信号的病灶为出血内膜岛^[12,18]。

本研究中有18例(48.6%)子宫腺肌症患者仅在 T_2 WI 可见病灶内高信号, 有14例(37.8%)在 T_2 WI、 T_1 WI 上均见高信号, 出现率均低于文献报道的50%~88%^[19], 这可能是因为异位内膜组织多为对月经周期激素变化反应迟钝的内膜基底型, 出血灶往往较少。此外, 即使没有出血或治疗, 这些高信号的数量常随时间变化^[3,12], 而且当异位内膜灶或出血灶较小时MRI诊断易存在主观忽视, 也可能造成影响。

本研究中有5例(13.5%)患者 T_2 WI 可见由内膜延伸至结合带的高信号线状条纹征, 高度提示子宫内膜基底层直接侵袭肌层可能, 从形态学上直观表明子宫内膜直接侵袭的病因学说。尽管线状条纹征出现率不高, 但其在子宫腺肌症的诊断中发挥着无法比拟的独特作用。此外, 有5例(13.5%)局限性子宫腺肌症表现为在增厚不明显的 T_2 WI 低信号结合带内可见点状或短条状高信号的微囊征, 该病灶可能是子宫内膜早期异位灶, 此时邻近肌层组织增生不明显。因本研究是回顾性分析, 无法进行针对性病理取材证实该推测。早期子宫腺肌症病灶的识别有利于提高临床诊疗效果, 因此进一步前瞻性研究尤为必要。

肌层内异位的内膜组织出血严重时常导致囊性子宫腺肌症的发生, T_2 WI 表现为与子宫分界欠清的低信号环包裹的多房混杂囊性信号灶, 低信号

环的囊壁有时表现为内层低信号和外层略高信号2层, 分别代表结合带和外肌层, 其中 T₁WI 高信号囊液表示出血^[3-4]。本研究仅发现1例浆膜下囊性子宫腺肌症, 且病灶范围较大累及左侧附件, 表现为多个大小不一的囊样混杂信号, 部分在 T₁WI 上表现为高信号。

3.3 合并症 有文献提及约39%的子宫腺肌症患者合并卵巢巧克力囊肿, 其中至少63%的患者结合带无明显增厚^[7], 本研究中子宫腺肌症合并巧克力囊肿患者13例(35.1%), 李小川和郎景和^[11]认为子宫内膜异位症是通过以局部雌激素升高为主的激素异常影响内膜下肌层的蠕动, 从而导致腺肌症的发生, 但二者复杂的关系还有待进一步探讨。

综上所述, 子宫腺肌症的MRI诊断征象主要包括结合带区异常增厚和T₁WI、T₂WI高信号, JZ_{max}≥10 mm、JZ_{diff}≥3.4 mm、JZ_{max}/M_{max}≥61%时其诊断价值显著, 其中JZ_{max}的诊断效能最佳, 而JZ_{diff}、JZ_{max}/M_{max}能不同程度弥补JZ_{max}的诊断不足。T₁WI和(或)T₂WI中的飘雪征、线状条纹征、微囊征、囊性出血征诊断子宫腺肌症具有独特性。综合评估这些MRI诊断征象可提高MRI的诊断价值, 为早期正确诊断子宫腺肌症提供可能。
