## 129个常染色体显性遗传性多囊肾病家系的致病基因检测及分析

卜磊, 马熠熠, 梅长林\*

海军军医大学(第二军医大学)长征医院肾内科, 解放军肾脏病研究所, 上海 200003

**[摘要]** **目的** 探讨中国常染色体显性遗传性多囊肾病(ADPKD)患者多囊肾病1型致病基因(*PKD1*)和多囊肾病2型致病基因(*PKD2*)的突变类型。**方法** 采用长链PCR和高通量测序方法对129个ADPKD家系的*PKD1*和*PKD2*基因进行突变分析,并用双脱氧链终止法测序技术对阳性突变进行验证。**结果** 在129个ADPKD遗传家系中共检测到116个家系存在*PKD1*或*PKD2*基因的118个突变位点,检出率为89.9%(116/129)。*PKD1*和*PKD2*的突变率分别为92.2%(107/116)和8.6%(10/116)。在这118个突变位点中,80个(67.8%)为新突变,38个(32.2%)为已知突变;109个位于*PKD1*(33个已知突变和76个新突变),9个位于*PKD2*(5个已知突变和4个新突变)。**结论** 新发现的*PKD1*和*PKD2*突变位点将有助于ADPKD患者的早期诊断和预后预测,并为临床干预提供基本的遗传信息。

### Detection and analysis of virulence genes for autosomal dominant polycystic kidney disease in 129 Chinese families

BU Lei, MA Yi-yi, MEI Chang-lin\*

Department of Nephrology, Kidney Institute of PLA, Changzheng Hospital, Naval Medical University (Second Military Medical University), PLA Institute of Nephrology, Shanghai 200003, China

**[Abstract]** **Objective** To investigate the mutation types of polycystic kidney disease 1 gene (*PKD1*) and polycystic kidney disease 2 gene (*PKD2*) in Chinese patients with autosomal dominant polycystic kidney disease (ADPKD). **Methods** The mutations of *PKD1* and *PKD2* in 129 inherited ADPKD families were analyzed by long PCR and high-throughput sequencing. The positive mutation was verified by Sanger sequencing method. **Results** A total of 118 mutation sites of *PKD1* or *PKD2* in 116 inherited ADPKD families were detected from 129 families, with the detection rate being 89.9% (116/129). The mutation rates of *PKD1* and *PKD2* were 92.2% (107/116) and 8.6% (10/116), respectively. Of the 118 mutation sites, 80 (67.8%) were new mutations and 38 (32.2%) were known mutations; and 109 mutation sites were located in *PKD1* (33 known mutations and 76 new mutations) and 9 in *PKD2* (5 known mutations and 4 new mutations). **Conclusion** The newly discovered *PKD1* and *PKD2* mutations may contribute to early diagnosis and prognosis prediction of ADPKD patients, and may provide basic genetic information for clinical intervention.

**[Key words]** high-throughput sequencing; autosomal dominant polycystic kidney; polycystic kidney disease gene; mutation

[Acad J Sec Mil Med Univ, 2019, 40(1): 7-13]

常染色体显性遗传性多囊肾病(autosomal dominant polycystic kidney disease, ADPKD)是人类最常见的遗传性疾病,其特征是双侧、多发并逐渐增长的液性囊肿压迫及破坏周围正常肾组织、引起肾脏不可逆性功能丧失,约占终末期肾病(end-stage renal disease, ESRD)的10%<sup>[1]</sup>。

ADPKD表型由位于16p13.3的多囊肾病1型致病基因(polycystic kidney disease 1 gene, *PKD1*)和位于4q21的多囊肾病2型致病基因(polycystic kidney disease 2 gene, *PKD2*)突变引起<sup>[2-3]</sup>,它们分别编码多囊蛋白1(polycystin 1, PC1)和多囊蛋白2(polycystin 2, PC2)。其中约85%~90%

的患者为 *PKD1* 基因突变导致,约 10%~15% 为 *PKD2* 基因突变导致,*PKD1* 突变的患者比 *PKD2* 突变者显现出更严重的临床表现和更差的预后,而且就致病突变的类型来说具有截短突变的患者比非截短突变的患者具有更严重的临床表现,这表明遗传因素在 ADPKD 患者的预后方面起着重要作用<sup>[4-5]</sup>。目前,ADPKD 的临床诊断主要基于使用年龄相关的囊肿数目的肾成像技术<sup>[6-7]</sup>,对于没有阳性家族史的年轻患者或 *PKD2* 基因突变的患者,使用目前的标准很难提供确定的诊断。因此,全面了解 *PKD1* 和 *PKD2* 基因的突变信息是 ADPKD 早期诊断和早期干预的关键。

*PKD1* 基因由 46 个外显子组成,编码序列为 12 912 个碱基;*PKD2* 基因由 15 个外显子组成,编码序列为 2 907 个碱基<sup>[8]</sup>。ADPKD 的致病以点突变致病为主,并且没有明显的突变热点或者热区,整个基因外显子区及内含子剪切位点附近均可能发生突变而致病,*PKD1* 和 *PKD2* 基因序列都是高度可变的<sup>[9]</sup>。迄今为止,在 ADPKD 突变数据库 (Autosomal Dominant Polycystic Kidney Disease Mutation Database, PKDB; <http://pkdb.mayo.edu/>) 中已经报道了共 1 273 种致病性 *PKD1* 突变和 202 种致病性 *PKD2* 突变。然而,大多数突变只在单一的家系中出现 1 次,重复的突变位点仅占 30%<sup>[5]</sup>。因此,有必要调查更多的家系确认这些已知的突变,并扩展新发现的突变。此外,在 PKDB 中列出的突变是从西方人群的研究中获得的,来自亚洲人群的突变数据有助于确认和拓宽这个数据库。本研究从 129 个中国 ADPKD 家系中筛选突变位点,通过与 PKDB 对比,确定已知的突变,发现未知的突变,为进一步深入了解 ADPKD 的致病基因突变情况提供有价值的信息。

## 1 资料和方法

1.1 临床样本收集 血液样本来自 129 个家系 (均为中国汉族人),每个家系至少包括 1 个患病个体。患病个体为 2016 年 1 月至 2018 年 8 月在海军军医大学 (第二军医大学) 长征医院肾内科确诊为 ADPKD 的患者。ADPKD 诊断标准:腹部超声或计算机断层扫描 (computed tomography, CT) 检查发现双肾囊肿数  $\geq 5$ ,有明确的多囊肾病家族史<sup>[6,10]</sup>。该研究通过海军军医大学 (第二军医大学) 长征医院伦理委员会审批,所有入选对象均签署知情同意书。每例入选对象取 5 mL 外周血,使用 DNA 提取试剂盒 (德国 QIAGEN 公司) 从淋巴细胞中提取基因组 DNA。

1.2 长链 PCR-高通量测序法检测突变位点<sup>[11]</sup> 采用长链 PCR 扩增 *PKD1* 和 *PKD2* 外显子以及外显子和内含子交界的非翻译区 (untranslated region, UTR)。使用长链 PCR 扩增的产物构建文库,上机进行高通量测序,对发现的突变位点采用一代测序 (以基因组 DNA 为模板重新设计引物) 进行验证。利用 TMAP 软件 (Ion Torrent 测序平台自带软件,美国 Thermo Fisher 公司) 将所有测序读数映射到 *PKD1* 和 *PKD2* 参考基因组 (*PKD1*: NM\_001009944.2; *PKD2*: NM\_000297.2)。采用人类基因组变异协会 (Human Genome Variation Society, HGVS) 推荐的标准命名法 (<http://www.hgvs.org/>) 命名本研究中鉴定的突变。使用 dbSNP 138、1000 Genomes Project、NHLBI GO Exome Sequencing Project (ESP, <http://esp.gs.washington.edu>)、HapMap 和 PVFD (正常人群中的变异频率) 数据库剔除非致病性突变。根据人类基因突变数据库 (<http://www.hgmd.cf.ac.uk>) 和 PKDB,将剩余的突变分为已知突变和新突变。对未检测出 *PKD1* 和 *PKD2* 突变的家系采用同样的方法检测常染色体隐性遗传多囊肾病致病基因——多囊肾/多囊肝病 1 基因 (polycystic kidney and hepatic disease 1, *PKHD1*)。

1.3 突变的致病性评价 首先,采用人类基因突变数据库和 PKDB 筛选出已知的致病性突变。然后,对先前未报道的可能致病的突变,使用 SIFT (<https://sift.bii.a-star.edu.sg/>)、MutationAssessor (<http://mutationassessor.org/>)、PolyPhen-2 (<http://genetics.bwh.harvard.edu/pph2/>) 等生物医学软件和美国医学遗传学与基因组学学会 (American College of Medical Genetics, ACMG) 序列变异的解释标准指南评估这些突变的致病潜力。最后,对于评估的致病突变,通过一代测序检测直系亲属的 DNA 序列进行家系共分离分析验证。

1.4 突变域分析 使用多个域数据库来分析 PC1 和 PC2 的突变域,包括简单模块体系结构研究工具 (<http://smart.embl-heidelberg.de>)、Pfam (<http://pfam.xfam.org/>) 和 PROSITE (<http://prospace.expac.org/>)。

## 2 结果

2.1 总体突变情况 本研究共调查了 129 个家系的突变特征。其中 116 个家系共检测到 107 个家系 *PKD1* 突变和 10 个家系 *PKD2* 突变,总突变率为 116/129 (89.9%)。*PKD1* 和 *PKD2* 的突变率分别为 92.2% (107/116) 和 8.6% (10/116)。有 4 个

家系发现 *PKD1* 等位基因纯合子突变 (等位基因各有 1 个致病突变), 为 *PKD1* 纯合子突变致病, 有 1 个家系检测出 *PKD1* 和 *PKD2* 均发生突变, 2 个突变位点均有致病性。116 个家系共检测到 118 个致病突变位点, 其中 80 个 (67.8%) 为新突变, 38 个 (32.2%) 为已知突变; 109 个突变 (33 个已知突变和 76 个新突变) 位于 *PKD1*, 9 个突变 (5 个已知突变和 4 个新突变) 位于 *PKD2*。

2.2 明确的致病突变 将检测到的突变与 PKDB 比对确定了 38 个已知致病性突变, 其中 33 个位于 *PKD1*, 5 个位于 *PKD2* (表 1)。在 33 个已知 *PKD1* 突变中, 18 个 (54.5%) 为无义突变,

4 个 (12.1%) 为移码突变, 9 个 (27.3%) 为错义突变, 2 个 (6.1%) 为剪接位点突变; 5 个已知 *PKD2* 突变均为无义突变。采用生物医学软件 (SIFT、MutationAssessor、PolyPhen-2) 对新发现的突变进行评估, 根据 ACMG 原则筛选出可能的致病突变, 并在患者家系中进行共分离分析验证, 发现 80 个新发现突变 (表 2)。其中 76 个 *PKD1* 新发现突变中有 10 个 (13.2%) 为无义突变, 33 个 (43.4%) 为移码突变, 5 个 (6.6%) 为整码突变, 20 个 (26.3%) 为错义突变, 7 个 (9.2%) 为剪接位点突变, 1 个 (1.3%) 为内含子变异; 4 个 *PKD2* 新发现突变分别为内含子变异、无义突变、错义突变和移码突变。

表 1 129 个 ADPKD 家系中发现的 38 个 *PKD1* 和 *PKD2* 已知致病突变

ADPKD: Autosomal dominant polycystic kidney disease; PKD1: Polycystic kidney disease 1 gene; PKD2: Polycystic kidney disease 2 gene

2.3 新生突变 对个体而言, 基因突变既可以由其父母遗传而来, 也可以后天获得, 后天获得的突变称为新生突变。本研究发现了 2 个 *PKD1* 的新生突变 (c.11257C>T 和 c.1987C>T), 分别为错义突变和无义突变, 2 个突变均为已知致病性突变。

2.4 *PKHD1* 的检测 在 13 个未检测出 *PKD1* 和 *PKD2* 突变的家系中, 检测出 3 个个体存在 *PKHD1* 等位基因的纯合子突变, 确定此 3 个个体为常染色体隐性遗传多囊肾病患者。

### 3 讨论

既往已有关于中国 ADPKD 患者中 *PKD1* 和 *PKD2* 突变分析的报道<sup>[12-16]</sup>, 但 ADPKD 家系的数量有限, 而且在这些研究中缺乏家系分析, 限制了对可能致病突变的验证。本研究共纳入 129 个 ADPKD 家系, 共检测到 118 个 *PKD1* 和 *PKD2* 突

变, 并对所有发现的突变进行家系分析及验证, 确定了它们的致病性。

在本研究中, *PKD1* 和 *PKD2* 突变的总检出率为 89.9% (116/129), 这比中国人群既往研究报道的 52.3%~85.8% 略高<sup>[12-16]</sup>。13 例多囊肾患者未发现 *PKD1* 和 *PKD2* 突变, 而临床表现符合 ADPKD 的诊断标准, 在这 13 例患者中检测 *PKHD1*, 发现 3 例患者为常染色体隐性遗传多囊肾病。然而仍有 10 例患者没有发现 *PKD1*、*PKD2* 及 *PKHD1* 的突变。类似现象既往也有报道<sup>[13,16]</sup>。虽然在这些患者中没有发现 *PKD1*、*PKD2* 突变, 但是 PC1 和 PC2 的蛋白水平可能因其他机制而下调。如微 RNA-17 和微 RNA-92 可以直接与 *PKD1* mRNA 的 3' UTR 结合, 转录后下调其表达水平<sup>[17]</sup>; DNA 远端上游元件结合蛋白 1 (far upstream element binding protein 1, FUBP1) 也能结合 *PKD2* 的 3' UTR 抑制其翻译<sup>[18]</sup>。这些机制可

以解释 *PKD1*、*PKD2* 突变在一些 ADPKD 患者中的缺失。

*PKD1* 和 *PKD2* 在本研究中的突变率分别为 92.2% (107/116) 和 8.6% (10/116, 其中 1 个家系 *PKD1* 和 *PKD2* 均发生致病性突变), 而大多数白人人群中 *PKD1* 和 *PKD2* 突变的比例分别约为 85% 和 15%<sup>[5]</sup>。本研究发现的 118 个致病突变中, 新突变 80 个, 其余 38 个是已知突变。新发现的突变所占比例 (67.8%) 高于之前报道的 16.7%~30%<sup>[5,19-20]</sup>。

无义突变、移码突变、典型剪接位点突变和较大的缺失突变为明确的致病突变; 而错义突变、非典型剪接位点突变和框内缺失突变的致病性是不确定的, 需要在家系的其他成员上验证<sup>[18]</sup>。然而在家系信息不完整的情况下评价错义突变的致病性是一个挑战。一些预测工具 (PolyPhen-2、SIFT 和 MutationAssessor) 已经被开发用来帮助评估错义突变的致病性。虽然本研究中使用预测工具评估的大多数错义突变的致病性与家系分析结果一致, 但经预测工具证实为良性突变的 1 个突变 (*PKD1* c.7544G>C) 在家系验证中检测到了遗传共分离, 为致病突变。在其他相关研究中也发现了类似的现象<sup>[21-22]</sup>。因此, 推荐将家系共分离分析作为评估错义突变致病性的金标准, 而不是预测工具。此外, 在 PKDB 中, 错义突变 (*PKD1* c.8572G>A) 被报道为高度可能的致病性突变<sup>[23]</sup>, 而本研究通过家系共分离分析证明是非致病性突变。同时, 由于 *PKD1* 和 *PKD2* 的等位基因异质性高, ADPKD 存在高频率的新突变。在本研究中, 在 116 个家系中共发现 2 个新生突变 (1.7%), 和之前的报道 (0.9%~3.1%)<sup>[19,24-25]</sup> 相符。

本研究也存在一些局限性。首先, 大多数新突变只在单个家系中发现, 其致病性需要通过不同的家系资料进一步验证, 特别是对于软件评估的可疑致病性突变。其次, 虽然我们收集了尽可能多的家系信息, 但是一些新的错义突变和框内缺失突变仍然没有完整的家系信息, 因此, 这些突变的致病性还有待确定。最后, 本研究虽然通过家系分析评价了非典型剪接位点突变的致病性, 但是最好使用小基因剪接实验 (minigene splicing assay)<sup>[26]</sup> 进一步分析它们的致病性。

综上所述, 本研究通过对 129 个 ADPKD 家系的 *PKD1* 和 *PKD2* 突变的研究, 在 116 个 ADPKD 家系中共发现 118 个致病突变 (109 个位于 *PKD1*、9 个位于 *PKD2*)。在 118 个突变中, 首次报道了 80 个新发现的突变, 另有 38 个是已知致病突变。新致病突变的发现将有助于 ADPKD 患者尤其是汉族人群患者的早期诊断和预后预测。
